

A circular loop of radius 0.3 cm lies parallel to a much bigger circular loop of radius 20 cm. The centre of the small loop is on the axis of the bigger loop. The distance between their centres is 15 cm. If a current of 2.0 A flows through the smaller loop, then the flux linked with bigger loop is:

- (1)  $9.1 \times 10^{-11}$  weber    (2)  $6 \times 10^{-11}$  weber    (3)  $3.3 \times 10^{-11}$  weber    (4)  $6.6 \times 10^{-9}$  weber

[JEE Main 2013]

Solution

Key Concept: The mutual inductance is the same whether current is passed through one coil or the other.

Let us first pass current  $I_R$  through the large coil,

$$\phi_r = M \cdot I_R = B \cdot \pi r^2 = \frac{\mu_0}{4\pi} \frac{2\pi I_R R^2}{(R^2 + d^2)^{3/2}} \cdot \pi r^2 \quad \text{[Since } R \gg r, \text{ magnetic field at a point on the axis of a coil formula can be used]}$$

$$\therefore M = \frac{\mu_0}{4\pi} \frac{2\pi R^2}{(R^2 + d^2)^{3/2}} \cdot \pi r^2$$

Let us now pass current  $I_r$  through the small coil,

$$\phi_R = M \cdot I_r = \frac{\mu_0}{4\pi} \frac{2\pi R^2}{(R^2 + d^2)^{3/2}} \cdot \pi r^2 \cdot I_r \quad \text{[M remains the same]}$$

$$\therefore \phi_R = 10^{-7} \frac{2\pi^2 R^2 r^2}{(R^2 + d^2)^{3/2}} \cdot I_r \approx 10^{-7} \times \frac{2 \times 10 \times 0.2^2 \times 0.3^2 \times 10^{-4}}{(0.2^2 + 0.15^2)^{3/2}} \times 2.0 = \frac{2 \times 10 \times 0.2^2 \times 0.3^2 \times 10^{-11} \times 2.0}{0.25^3}$$

On simplification, correct option = (1).
